

Rafael Viñoly Architects have just announced the completion of The Translational Research Center at Penn. This first expansion phase in an overall master plan for Penn Medicine that includes both the University of Pennsylvania Health System and the University's School of Medicine, the Translational Research Center builds on the original Perelman Center while simultaneously preserving its urban character and laying the groundwork for future development. As a translational facility, the new building unites research and clinical functions under one roof to allow the practices of scientific investigation and patient care to inform one

another through close proximity.
