

With undeniable talent, Zaha Hadid Architects keep pushing the envelope of architecture, while injecting innovative ideas that make their projects more dynamic and fluid.

A perfect example is this recently designed museum, located in Au-Di, Taipei county, northern part of Taiwan. This dynamic site is situated on the end corner of a steep sloping hill.

The form harmonizes with the surrounding landscape and is embedded into its natural topography. The structural system of the conic walls give a distinct character to the inside of the museum. The interstitial spaces of each conic wall create the fluid circulation system linking all the spaces from exterior landscape to interior museum.
