

**The Openhouse is embedded into a narrow and sharply sloping property in the Hollywood Hills, a challenging site that led to the creation of a house that is both integrated into the landscape and open to the city below.**

Retaining walls are configured to extend the first floor living level into the hillside and to create gardens on two levels. The front, side and rear elevations of the house slide open to erase all boundaries between indoors and out, connecting the spaces to gardens on both levels.

Plans

Sketches of all roof elements, the planes and heights of original facade and garden side

bold light to cast in the interior and exterior. The base of the building is a dark, textured material, and the overall design is a blend of natural and modern elements.

The presence of a fireplace in the living area provides a warm and cozy atmosphere. The dark tones of the furniture and the stone fireplace create a sophisticated and modern aesthetic. The large windows offer a stunning view of the city at dusk, making this a perfect space for relaxation and entertainment.

6th and 7th floor views of the open house, as shown in the Open House application site. The
