

Danish architectural company schmidt hammer lassen architects has won a 52,863 m² mixed-use complex "Konstitucijos Avenue 21" in Vilnius, the capital of Lithuania. The project is the result of a successful collaboration with Oslo-based Lund+Slaatto Architects, a strategic partner of schmidt hammer lassen architects. The client had requested cross-scandinavian architect teams for the task which led Lund+Slaatto to invite schmidt hammer lassen to join them.

"The inspiring cooperation with our colleagues from Lund+Slaatto has surely contributed to our winning the project. We would consider expanding our collaboration with them in future projects if they fit both our profiles," said John Lassen, responsible partner for schmidt hammer lassen architects.

schmidt hammer lassen architects have targeted the Baltic countries for a while as a potential market for their architecture. In 2008, the company won a competition for the sustainable masterplan project EcoBay in Tallinn, Estonia.

The project is situated in the rapidly growing Snipiskes district in the north of Vilnius and comprises offices, apartments, shopping, fitness and conference facilities, and a hotel.

The complex has three high building volumes creating a dynamic composition both within the block and towards the future neighbouring buildings. The buildings define the central space and the various passages and respect the objective of creating a coherent skyline in the region with four different height zones on the site. Each of the three constellations comprises individual units which can be built in separate building phases – and in any sequence one might find desirable at the time.

In the northeastern part of the site, an architectural peak has been added to the volume, whereby the height is escalated in a rotational movement from the lowest element in the south east towards the tallest element in the northeast. The buildings are situated displaced from each other resulting in interesting interactions with the other volumes within the block.

The offices are located in the highest building, which gives an opportunity for company exposure due to its landmark character. The north-western building contains offices and residential units on the top floors positioned to receive good sunlight and views. The hotel is located in the foremost building and easy access towards Konstitucijos. On the ground floor, retail shops are directly accessible from the main streets to contribute to urban life along and through the city block.

Scandinavian architects to build urban complex in Vilnius

Wednesday, 28 October 2009 06:51 - Last Updated Wednesday, 28 October 2009 07:06

...the city's main business district, the complex will be a mix of residential, commercial and public spaces. The main building is a 25-story glass skyscraper, which will be the tallest building in Vilnius. The complex will also include a shopping center, a hotel, and a public square. The project is being developed by a consortium of Scandinavian architects, including the Danish firm Cobe and the Swedish firm SBB.
