

The proportions of this house have been dictated by the restraints of the site. A flood level two meters above natural ground and the 405m² area of the site meant that this home had to be developed across three levels. Living occurs on the mid level and opens to both a rear deck and central courtyard deck to provide a connection to the outdoors where close proximity to the landscaped yard was not possible.

Openings and the ability to frame a view is a key element in the design of the building.
